

LRRA Website Content Audit

UX Case Study Version

Objective

The Content Audit examined LRRA's existing website from a visitor-centered perspective, with particular attention to:

- Information hierarchy
- Navigation complexity
- Content duplication
- Outdated or low-value content
- Visitor intent
- Content maintenance
- Opportunities to use WordPress Posts and other existing functionality more effectively

The central finding was:

LRRA does not necessarily have too much content. It has too much content presented at the same navigational level.

This distinction became the basis for the recommended information architecture.

Homepage

The homepage currently functions simultaneously as an organizational introduction, repeater reference, news archive, event listing, resource directory, and community bulletin board.

UX recommendation: Establish a clear visitor journey:

Who is LRRA? → Why does it matter? → How do I get started? → What's happening now? → How do I participate?

Current and upcoming events should be surfaced on the homepage, while older material should be managed through a curated post archive.

The audit also identified an opportunity for LRRA to become **curators rather than archivists**: older posts should be evaluated for continuing audience value rather than automatically preserved indefinitely.

Amateur Radio

The existing Amateur Radio section mixes beginner education, operating information, radio history, specialized technical material, and unrelated subject matter.

UX recommendation: Organize content around visitor intent rather than subject accumulation.

A potential structure:

- **Getting Started**
- **Operating & Learning**
- **Radio History** — optional archive/resource
- Remove unrelated material from the LRRR information architecture.

The strongest opportunity is a coherent beginner pathway that answers:

What is amateur radio?

Why might I be interested?

How do I get licensed?

What equipment do I need?

How do I make my first contact?

Sponsors

The existing sponsor presentation demonstrates an important content-governance issue: recognition is useful, but inconsistent visual assets create maintenance problems.

UX recommendation: Verify the sponsor list and present sponsors consistently, using business names and website links rather than making logo acquisition a prerequisite for publication.

About Us

The audit identified significant consolidation potential.

A large collection of organizational pages can be reorganized around actual visitor needs:

About LRRR

- Who We Are
- Leadership
- History
- Gallery
- In Memoriam

Organization

- Member Login
- Documents & Records
- Meeting Minutes
- Constitution & By-Laws
- Financial/IRS documents

Membership

- Join LRRA

This separates **public-facing persuasion and orientation** from **organizational records**.

Repeaters

Nine pages currently represent several distinct user needs.

The recommended information architecture reduces this complexity to approximately four purposeful destinations:

Repeaters

- Repeater List & How to Use
- Coverage & Repeater Sites
- Digital & Linked Systems
- Local Nets

This is a strong example of **content consolidation rather than content deletion**.

Technical information can remain available while the primary interface becomes substantially easier to understand.

Contact

The Contact page demonstrates another recurring issue: information duplication.

The contact form itself serves its purpose well, but additional amateur-radio education, emergency information, equipment information, and other material unnecessarily compete with the primary task.

UX recommendation: Make Contact task-oriented and route visitors to the authoritative page for each subject rather than duplicating content.

For Sale

Unlike several other areas, For Sale appears to have strong demonstrated audience interest.

UX recommendation: Preserve the function while improving its content model.

WordPress Posts provide a natural structure for individual classified listings, allowing:

- Consistent listing presentation
- Individual URLs
- Dates
- Categories/tags
- Archiving
- Easier administration

A listing expiration/curation process would address the current accumulation of outdated listings.

Emergency Services / ARES

The audit found valuable LRRRA-specific information mixed with general ARES information, technical repeater instructions, external material, and lengthy supporting documents.

The strongest content concerns **what LRRRA actually contributes**: repeater infrastructure, emergency power, and backup communications capability.

UX recommendation: Make LRRRA's role the central message, followed by ARES, preparedness/training, and volunteer opportunities.

Calendar & Events

The existing structure treats recurring events as permanent website destinations.

UX recommendation: Shift from a static-page model to a **content publishing model**:

Calendar → authoritative schedule

Homepage → selected current/upcoming events

Posts → individual event announcements and reports

Archive → historical events retained according to LRRR's editorial judgment

This eliminates unnecessary navigation while giving LRRR greater control over current content.

Audit-Level Findings

Across the site, several recurring UX patterns emerged:

1. Accumulated content has become navigation

Pages were often created to solve an immediate information need and subsequently became permanent navigation items.

2. Information is duplicated

Repeater instructions, amateur-radio education, ARES information, and other subjects appear in multiple locations.

3. Historical value and current usefulness are being conflated

Older information can be valuable without necessarily deserving a place in primary navigation.

4. The site needs content governance

LRRR would benefit from deciding:

- What deserves permanent navigation?
- What becomes a post?
- What gets archived?

- What should eventually be removed?
- Who reviews outdated information?

5. The redesign should respect visitor time

The objective isn't to eliminate LRRRA's history or technical knowledge. It is to **progressively disclose information** so visitors see the most useful information first and can go deeper when they choose.

Resulting UX Direction

The Content Audit establishes the foundation for the next phase:

Content Audit → Information Architecture / Sitemap → Wireframes → Visual UI Design → WordPress Implementation

The audit suggests that the eventual redesign should be **simpler at the surface while preserving substantially more depth underneath.**

The work isn't primarily a visual redesign; it's a restructuring of accumulated information around user needs.
